CollectionConnection 3.0

CollectionConnection 3.0

- Integrated solution for:
 - Flexible mapping and combining different information sources to one Xml based data store
 - Fast information retrieval
 - Http-based access for flexible content dissemination
 - Image server integrated

Powerful Indexing

- Map and combine multiple offline and online data-sources to structured hierarchical Xml
 - Database acces: Ado & ODBC, direct access to Sql-server, MySql, Oracle
 - Marc
 - Xml files (local & remote)
 - OAI
 - SRU
 - Adlib
 - Local documents using IFilter interface
- Target Xml is flexible; can conform to standards (e.g., SKOS, Qualified Dublin Core, CDWA Lite)

Powerful Data Mapping

- Integrated scripting environment for advanced data manipulation
- Combine multiple data sources
 - Compare to SQL inner join, but on different sources using Xpath specification
- Example:
 - Combine local collection database (Sql-server on Intranet) with remote social tagging database (MySql on webserver) and remote Xml-based thesaurus
- Relate records dynamically during indexing
 - E.g., to highlight thesaurus-terms in object descriptions

Powerful Data Mapping - script

                            37
                                  dim objectDimensieType1
     IndexPreprocessingScript
                            38
                                  dim objectDimensieWaarde2
                            39
                                  dim objectDimensieType2
                            40
                                  objectDimensieWaarde1=xpath("/object/dimensie/waarde")
                                  objectDimensieType1=xpath("/object/dimensie/@type")
                            41
                            42
                                  objectDimensieWaarde2=xpath("/object/dimensie[2]/waarde")
                            43
                                  objectDimensieType2=xpath("/object/dimensie[2]/@type")
                            44
                                  ccTag=objectDimensieType1 + " x " + objectDimensieType2 +
                            45
                                end sub
                            46
                            47
                                sub objectMedia
                            48
                                  dim objectMedia
                            49
                                  objectMedia=xpath("/object/bestand/@id")
                            50
                                  ccTag=objectMedia +".jpg"
                            51
                                end sub
                            52
                            53
                                sub objectMediaNew
```

Powerful Information retrieval

- Sub-second, field-based Full Text Search
- Advanced search options
 - Phrases, whole-field matching, wildcard matching, proximity
- Auto-suggest functionality based on NGrams
- Spelling suggestions
- Facetted search and filtering
- Relevance ranking (ranking can be influenced by additional queries)
- Hit highlighting & hit summarization
- Support for stemming (multiple languages)

Optimized for performance; no caching or cache-warming

Integrated Data Server

- One index, one server instance, multiple Http-servers for multiple target audiences
 - Filter-queries to limit results for specific audience
 - XSLT to support different standards from one base index
- Support for CCXML, OAI, SRU 1.1
- Support for distributed search

Example - XSLT in Data Server

Integrated Image Server

Many publishing platforms

- Integrated ASP-like scripting environment to create standalone solution, e.g., collection-site on USB-stick
- Integration with Joomla & Mediawiki
- Code available for, e.g., .Net & PHP
- Javascript library for Ajax based integration of search in website (under development)
